

Plowing for corn Dec 15

Discing before it is plowed

Time - install if land does not work

Late deep fall plowing is good to kill insects. Fall plowing is ~~not~~ ^{is} used

for making better yields but to get the ground ~~plowed~~ ^{in time}

Spring plowing should be just as deep but if shallow plowing

has been used do not plow more than $\frac{1}{2}$ inches deeper

Time of planting - varies considerably but usually from May 1-20

Rate of planting depends upon fert. of soil & quality of seed
checking is recommended if ground is muddy, but drilled corn has better quality ears

In checking on thin land put two kernels and in rich " " 3
In drilled corn the average is about 14 in.

Corn should be planted; it depends on soil condition but it should be planted shallow ^{but it should be drilled to cover}

cultivation expands
principals are to get close
to corn and go deep the first time
after that go shallow
